A Summer Industry Internship – I Report

on

AgriScanner: Scan, Understand, and Hear Your Farm Product Label

During

III Year I Semester

Submitted to

The Department of Information Technology

In partial fulfillment of the academic requirements of

Jawaharlal Nehru Technological University

For

The award of the degree of

Bachelor of Technology in Information Technology

By

N.PRAKEERTHAN REDDY 24311A1266

K.HEMANTH KUMAR REDDY 24311A1272

J.AKSHITH PATEL 24311A1275

Under the Esteemed Guidance of

Mr. G. Nuthan Kumar

Assistant Professor ,Department of IT

Department of Information Technology

Sreenidhi Institute of Science and Technology

Yamnampet, Ghatkesar, R.R. District, Hyderabad - 501301Affiliated to

Jawaharlal Nehru Technology University

Hyderabad – 500085

2026-2027

CERTIFICATE

This is to certify that this Summer Industry Internship – I Report on "**Agri Scanner-Scan, Understand and Hear Your Farm Product Label**", submitted by N. PRAKEERTHAN REDDY 24311A1266, K. HEMANTH KUMAR REDDY 24311A1272, J. AKSHITH PATEL 24311A1275 in the year 2026 in partial fulfillment of the academic requirements of Jawaharlal Nehru Technological University for the award of the degree of Bachelor of Technology in Information Technology, is a bonafide work in industry internship that has been carried out **during II B Tech IT II Semester Summer** will be evaluated in **III B Tech IT I Semester** under our guidance. This report has not been submitted to any other institute or university for the award of any degree.

`

ACKNOWLEDGEMENT

I would like to express my gratitude to all the people behind the screen who helped me to transform an idea into a real application.

I would like to thank my Internship coordinator **Mr. G. NUTHAN KUMAR** for his technical guidance, constant encouragement and support in carrying out my project at college.

I profoundly thank **Dr. Sunil Bhutada**, Head of the Department of Information Technology who has been an excellent guide and also a great source of inspiration to my work.

I would like to express my heart-felt gratitude to my parents without whom I would not have been privileged to achieve and fulfill my dreams. I am grateful to our principal, **Dr. T. Ch. Siva Reddy,** who most ably run the institution and has had the major hand in enabling me to do my project.

The satisfaction and euphoria that accompany the successful completion of the task would be great but incomplete without the mention of the people who made it possible with their constant guidance and encouragement crowns all the efforts with success. In this context, I would like thank all the other staff members, both teaching and non-teaching, who have extended their timely help and eased my task.

N. PRAKEERTHAN REDDY 24311A1266
K. HEMANTH KUMAR REDDY 24311A1272
J. AKSHITH PATEL 24311A1275

`

Abstract

AgriScanner is a farmer-focused tool that scans seed and pesticide packaging and explains the product information in the farmer's preferred language. Using a mobile phone camera, the system captures label details such as product name, crop suitability, recommended usage, precautions, and expiry date. It then presents the information in clear, accessible language, helping farmers better understand product instructions and make informed decisions.

The project combines image processing, text recognition, and language translation to make agricultural product information easier to access. Its workflow includes capturing a product label, extracting relevant text, translating or simplifying the details, and presenting the explanation to the user. The system is intended to support farmers who face language or literacy barriers when reading packaging.

Future development may include support for more regional languages, voice-based explanations, and links to verified agricultural information. By making product labels easier to understand, AgriScanner aims to improve access to useful agricultural guidance for farmers.

INTRODUCTION

1.1 Introduction

Agricultural product labels contain information that can affect product selection and safe use, including product identity, intended use, directions, restrictions, warnings, and expiry details. In practice, users may have difficulty locating or interpreting this information because labels can use small print, technical terms, or a language the reader does not prefer. A label image may also be blurred, cropped, or poorly lit, making some details hard to verify.

AgriScanner is a proposed AI-powered assistant that helps users read and understand visible information on agricultural product labels. It combines image capture or barcode scanning, optical character recognition (OCR), product identification, retrieval from trusted label or product sources, plain-language explanation, multilingual text, and speech output. Its purpose is to improve access to label information while keeping the source and confidence of each explanation visible.

The project follows a validation-first approach. It checks whether the image and extracted text are usable before generating an explanation. Unclear or unverified information should be flagged rather than guessed. AgriScanner is an information assistant: it explains label content and does not prescribe chemical use or replace the product label, manufacturer, or agricultural officer.

1.2 Key Concepts

Agricultural product label: A label provides product-specific details such as the product name, intended use, directions, warnings, restrictions, and expiry information. AgriScanner should report only fields that are visible or supported by an authorized reference.

Optical character recognition: OCR converts text in an image into machine-readable text. Image quality affects extraction, so the system needs a quality check and must expose uncertain or missing text.

Product identification and verification: The application can use visible label fields or a barcode to identify a product. Identification should be checked against trusted product data before external details are presented as verified.

Plain-language explanation: A language model can restate verified label content in simpler wording. The explanation must retain warnings and restrictions and must not add unverified directions.

Multilingual and speech access: The interface is designed to present explanations in a preferred language and read them aloud. Translation and speech quality require review by language speakers and users.

Safety gate and uncertainty: A safety gate checks for missing, illegible, or conflicting information. When confidence is low, the system should say so, request a clearer image, or refer the user to an

`

appropriate source.

1.3 Scope

The initial project scope is a focused assistant for agricultural product labels, beginning with a defined region, language, and product category. The presentation identifies seed packets or pesticide labels as candidate inputs. The interface includes image capture or barcode scan, OCR, product identification, simplified multilingual text, and text-to-speech. The architecture includes a web or mobile interface, an AI agent, verified retrieval, and safety checks.

The scope includes the following work:

- Capture a product label image or scan a barcode and check whether the input is readable.
- Extract visible text and organize relevant fields such as product name, intended use, directions, warnings, and expiry.
- Compare product information with trusted label or product references when available.
- Explain verified label content in plain language and a selected language.
- Preserve cautions and restrictions, identify uncertainty, and avoid generating missing safety instructions.
- Provide audio playback and an accessible interaction flow.
- Evaluate OCR, field correctness, explanation faithfulness, translation, speech intelligibility, warning preservation, response time, and usability against defined targets.

Follow-up question answering, additional Indian languages, offline operation, barcode verification, broader product coverage, and referral support are future extensions. The system does not diagnose crop disease, recommend a treatment, determine a safe dose, or replace official label instructions.

`

ABOUT THE PROJECT

2.1 Project Overview

AgriScanner is framed as an AI-enabled label-reading assistant. A user submits a label image or barcode through a web or mobile interface and selects a language. The system checks image quality, extracts text, identifies the product when evidence permits, and retrieves matching details from trusted sources. An AI agent then produces a structured response that separates visible label content from externally verified information. The interface displays a concise explanation and can read it aloud.

The system is intended for farmers, local-language users, field workers, and rural support groups. The first release should be limited to a manageable region, language, and category so that the team can validate data quality and user experience before expanding coverage.

2.2 Project Workflow and Development Experience

The project workflow is organized into stages that can be implemented and evaluated independently:

Requirements and initial scope. Select a region, language, and product category. Define the user tasks, label fields, trusted data sources, privacy requirements, and the boundaries of the assistant.

Interface and input capture. Create a simple upload or camera flow, with barcode input where supported. Give users clear guidance on framing, lighting, and retaking an unreadable image.

Image quality and OCR. Assess blur, crop, and legibility before extracting text. Retain the OCR output and confidence signals so that uncertain text can be flagged.

Product identification and retrieval. Match the extracted fields or barcode against authorized product records. Return a verified match only when the evidence is sufficient; otherwise identify the missing information.

Explanation and language support. Generate a structured, plain-language explanation from the verified label content. Keep directions, warnings, and restrictions traceable to their source.

Speech and interaction. Provide audio playback in the selected language. Follow-up questions are a planned extension and should use the same evidence and safety controls.

Validation and iteration. Test clear, blurry, cropped, incomplete, and unseen labels. Compare outputs with a verified transcription and review explanations, translations, speech, and warnings with appropriate evaluators.

Documentation and demonstration. Document the architecture, data sources, limitations, evaluation method, and unresolved cases. Demonstrate a complete scan-to-explanation flow using authorized sample labels.

2.3 Challenges Faced During Development

`

Small, blurry, or incomplete labels. Glare, low resolution, curved packaging, crop boundaries, and small fonts can reduce OCR quality. The interface needs to detect common input problems and make retaking easy.

Product matching. Similar product names or incomplete label fields can lead to an incorrect match. External data should be shown only after matching against a trusted source.

Faithful simplification. A short explanation can accidentally omit a restriction or introduce meaning not present on the label. The output should be checked against the source and preserve critical warnings.

Language quality. Literal translation may be unclear or ambiguous. Local-language review is needed, especially for agricultural terms and safety warnings.

Uncertainty and safe boundaries. The assistant must not fill gaps with plausible-sounding instructions. It needs clear rules for low confidence, conflicting sources, and referral.

Privacy and connectivity. Uploaded images may contain identifying information, while rural connectivity may be limited. Data handling and low-connectivity behavior need to be defined before deployment.

`

TECHNOLOGY OVERVIEW

3.1 Microsoft Foundry and AI Agent

The supplied architecture places Microsoft Foundry at the orchestration layer for an AI agent. The agent coordinates OCR, product-data retrieval, explanation generation, and safety checks. The exact service configuration should be selected during implementation based on availability, compatibility, cost, and project requirements.

3.2 Image Understanding and OCR

Document Intelligence or Vision services are identified in the project presentation as candidate OCR components. Their role is to extract visible label text and support field organization. OCR output is evidence to review, not a guarantee that the label was read correctly.

3.3 Trusted Label and Product Data

AgriScanner needs an authorized, region-appropriate source for product labels and product information. Retrieved data should be linked to the identified product and kept separate from text read directly from the image. If a reliable match is unavailable, the interface should state that limitation.

3.4 Language Model and Explanation

A language model can simplify verified text and organize it into fields such as product name, intended use, directions, warnings, and expiry. Prompting and output checks should preserve the meaning of the source and prevent the model from inventing dosage or application details.

3.5 Speech and User Interface

Azure AI Speech is identified in the supplied architecture for text-to-speech and optional speech input. The interface presents the explanation in readable text and offers audio playback. Language availability and speech quality must be confirmed for the chosen region and evaluated with users.

3.6 Safety, Privacy, and Monitoring

Safety checks should detect unreadable fields, missing warnings, unsupported product matches, and conflicts between sources. The system should minimize stored user data, protect uploaded images, and provide useful error messages.

`

Monitoring should support troubleshooting without turning uncertain output into confident advice.

`

IMPLEMENTATION

The implementation plan below follows the project presentation. It describes a staged prototype workflow; completion and performance should be recorded only after each stage is built and evaluated.

Step 1: Requirement analysis

- Choose the initial region, language, user group, and product category.
- Define the supported label fields, safety boundaries, data sources, and privacy needs.
- Set evaluation metrics and target values before experiments.

Step 2: Authorized data preparation

- Collect sample labels and reference records with permission.
- Prepare verified transcriptions and product identifiers for evaluation.
- Record source, date, region, language, and any usage restrictions for each reference.

Step 3: Interface and capture

- Build the web or mobile flow for image capture, upload, barcode input, and language selection.
- Show practical retake guidance for blur, glare, crop, and low light.

Step 4: Image validation and OCR

- Check image quality before processing.
- Extract visible text and organize candidate fields.
- Keep uncertain OCR text visible for review and avoid silently completing missing fields.

Step 5: Product identification and retrieval

- Match barcode or extracted fields to authorized product records.
- Return a verified match only when the evidence meets the defined threshold.
- Separate retrieved details from text extracted from the label.

Step 6: AI explanation and safety checks

- Generate a simple explanation from supported source text.
- Preserve warnings, restrictions, and directions as written.
- Reject unsupported instructions and flag uncertainty, unreadable text, or conflicting records.

`

Step 7: Language and audio output

- Render the explanation in the selected language.
- Add text-to-speech playback where the language is supported.
- Review translations and speech with language speakers and representative users.

Step 8: Testing and evaluation

- Compare OCR with manual transcription and product fields with verified references.
- Review explanation faithfulness and warning preservation against the source label.
- Assess translation quality, speech intelligibility, unreadable-information detection, response time, and usability.
- Record results and limitations; do not present targets as achieved results.

Step 9: Demonstration and documentation

- Demonstrate the scan-to-explanation flow with authorized sample data.
- Document system components, data handling, known limitations, and evaluation results.
- Use a referral or retake recommendation when the system cannot support an answer.

Step 10: Future enhancements

- Consider additional Indian languages and product categories after local validation.
- Explore low-connectivity operation, barcode-based verification, speech conversation, and authorized database integrations.
- Add optional local-support referral where appropriate.

`

RESULT

5.1 Project Outputs

The supplied project presentation describes a prototype concept and a phased development plan. Based on that material, the outputs to be demonstrated are:

- An image or barcode input flow with an image-quality check.
- OCR extraction and product identification supported by trusted references.
- A structured, simplified explanation in a selected language.
- Text-to-speech playback for supported languages.
- Safety checks that preserve warnings, flag low confidence, and request a retake or referral when needed.
- A documented architecture, limitations, and evaluation plan.

5.2 Evaluation Plan

The project presentation defines evaluation areas but leaves target values editable and states that no results are claimed. The following measures should be populated after testing:

Metric	Evaluation method	Status
OCR accuracy	Compare extracted text with verified manual transcription	Target and result to be entered after testing
Product field correctness	Compare identified fields with verified source records	Target and result to be entered after testing
Explanation faithfulness	Review each explanation against its source label	Target and result to be entered after testing
Translation quality	Review with language experts or fluent speakers	Target and result to be entered after testing
Speech intelligibility	Conduct listener review or task-based assessment	Target and result to be entered after testing
Unreadable information detection	Test blur, crop, glare, and incomplete label samples	Target and result to be entered after testing

`

Warning preservation	Check that warnings and restrictions remain present	Target and result to be entered after testing
Response time and usability	Timed user tasks and structured user feedback	Target and result to be entered after testing

5.3 Expected Benefits

- Easier access to product information on labels.
- Clearer explanations of warnings and directions.
- Voice access for users who prefer audio or have difficulty reading dense print.
- A clearer path to request a retake or seek help when information is uncertain.

These are intended benefits, not measured outcomes. Any claim about accuracy, time savings, safety improvement, or adoption should be supported by completed evaluation.

`

CONCLUSION

AgriScanner addresses a practical access problem: agricultural product labels can be difficult to read, interpret, or use in a preferred language. The project proposes a workflow that combines image capture, OCR, product verification, plain-language explanation, multilingual output, and speech. A validation-first design keeps the explanation tied to visible or verified information and makes uncertainty explicit.

The central implementation requirement is trustworthiness. AgriScanner must preserve warnings, distinguish label text from retrieved information, protect user data, and avoid inventing dosage or application instructions. Its usefulness depends on the quality of images, authorized product references, local-language review, and careful testing.

The project material provides a system design, prototype feature set, development plan, and evaluation framework, but it does not report measured results. The next step is to complete the focused prototype and test it with authorized labels and representative users. Expansion to more regions, languages, product types, and low-connectivity settings should follow evidence from that evaluation.

`

BIBLIOGRAPHY

This report follows the supplied chapter structure and is based on AgriScanner project materials. A separate AgriScanner PDF or measured test report was not provided.

1. Agri Scanner project presentation, supplied source deck, 14 slides. Used for project scope, user groups, architecture, prototype features, safety boundaries, development plan, and evaluation metrics.
2. Project report outline supplied as a format reference. It was used only to retain the chapter structure and appendix organization.
3. AgriScanner_Project_Deck.pptx

ABSTRACT

This project explores the deployment of an automated multi-cloud network using Juniper Contrail, focusing on seamlessly connecting workloads in both private and public cloud environments. The goal is to ensure secure, high-performance communication between diverse cloud infrastructures while leveraging automation and software-defined networking (SDN) principles. By integrating tools such as vSRX Virtual Firewalls, Contrail's SDN capabilities, and advanced security features, the project aims to optimize cloud network management. The project workflow includes environment setup, deployment, and testing, demonstrating improvements in connectivity, performance, and automation. The future scope of the project includes scaling the network architecture to accommodate larger, more complex applications and integrating cutting-edge technologies like intent-based networking and Secure Access Service Edge (SASE) solutions to further enhance security and performance across the multi-cloud network.
